California, this is not like you. Usually you are more conservative and protective environmentally than the rest of us. You go around setting a good precedent. Please do not set this standard of 1100 mcg/day/kg. There is a lot of evidence that glyphosate is extremely dangerous; it has spread into the drinking water and we are encountering it from all directions. This standard you propose is nearly twice the EU standard which many scientists already recognize as being too high.

Please take the conservative approach. Glyphosate needs to be banned. I feed my family foods from California every day. All Americans depend on California setting a good environmental precedent, both because you grow much of our food and because you set a high bar for the rest of us. Please consider this.

Thank you.
